

ABSTRACT OF THE DISCLOSURE

A golf club head includes a golf club head body, a striking plate mounted to a front side of the golf club head body, and a perimeter wall extending rearward from a perimeter of the golf club head body. A reinforcing
5 layer is integrally and tightly bonded to a back of the striking plate. The reinforcing layer completely covers an engaging edge in a joint area between the striking plate and the perimeter wall, thereby improving structural strength of the golf club head and absorbing vibrations generated as a result of striking a golf ball.
